

Successful Corsi-Rosenthal Box Build!

The University of Maryland sponsored a DIY air filtration box build at the Lexington Park Library to promote their study on indoor air. The study, led by Dr. Kate McPhaul at the PHABLab, focuses on the thoughts, opinions, and feelings people have about indoor air and devices that kill germs in the air. By holding these events, the team is able to recruit for focus groups to collect information in different communities. The information helps the study team identify what is known and unknown about indoor air, allowing them to be able to educate community members about the importance of indoor air and germ-killing lights.
